

# Integrated Organizations

Left Brain is at its core an organizational engineering firm.

We started the business with the idea of helping organizations more effectively harness the incredible systems and practices available that have simply been outside the budget of most medium to small organizations.

Left Brain can help your organization deploy an integrated system of information technology, web communications and data management services.

When we say services, we mean actual services, that you pay for as you need, not a bloated software system that no one knows how to use. You pay a quarterly fee according to usage of a specific and clearly priced set of services.

Some times during the year you need more help than others. Other times of year those resources represent unproductive money.

Here, not only do you tap into a clear system of predictably priced expertise, but you get to manage your budget more effectively, allowing you to invest more money in the infrastructure and marketing practices necessary to take your organization or business to the next level.

How do we offer such a rich array of services so affordably priced?

Simple.

We use tools that were built in similar fashion, using the power of community to build better, faster, safer, stronger software for the benefit of the programming community to help shift our own industry towards even more of a completely service oriented model.

Our world is still treating software as if it were gold, spending so much time pounding it into trinkets, that we've forgotten its value as mode of exchange, including its predictable use in applications whose primary function is for the comfort and enjoyment of humans.

When the value returns to, as it should, the value of the commodity to improve the quality of your business and personal life, rather than the scarcity of the commodity, or false scarcity, everyone benefits. It probably means fewer multi-zillionaires, but a lot of very comfortable people, living and working across the globe
